#### **Problem H: Prime Bases**

Source: primebases.{c,cpp,java}

Input: primebases.in Output: primebases.out

Given any integer base  $b \ge 2$ , it is well known that every positive integer n can be uniquely represented in base b. That is, we can write

$$n = a_0 + a_1 * b + a_2 * b * b + a_3 * b * b * b + \dots$$

where the coefficients  $a_0$ ,  $a_1$ ,  $a_2$ ,  $a_3$ , ... are between 0 and b-1 (inclusive).

What is less well known is that if  $p_0$ ,  $p_1$ ,  $p_2$ , ... are the first primes (starting from 2, 3, 5, ...), every positive integer n can be represented uniquely in the "mixed" bases as:

$$n = a_0 + a_1 p_0 + a_2 p_0 p_1 + a_3 p_0 p_1 + a_2 p_0 + \dots$$

where each coefficient  $a_i$  is between 0 and  $p_i$ -1 (inclusive). Notice that, for example,  $a_3$  is between 0 and  $p_3$ -1, even though  $p_3$  may not be needed explicitly to represent the integer n.

Given a positive integer n, you are asked to write n in the representation above. Do not use more primes than it is needed to represent n, and omit all terms in which the coefficient is 0.

### **Input**

Each line of input consists of a single positive 32-bit signed integer. The end of input is indicated by a line containing the integer 0.

### Output

For each integer, print the integer, followed by a space, an equal sign, and a space, followed by the mixed base representation of the integer in the format shown below. The terms should be separated by a space, a plus sign, and a space. The output for each integer should appear on its own line.

# **Sample Input**

## **Sample Output**

```
123 = 1 + 1*2 + 4*2*3*5

456 = 1*2*3 + 1*2*3*5 + 2*2*3*5*7

123456 = 1*2*3 + 6*2*3*5 + 4*2*3*5*7 + 1*2*3*5*7*11 + 4*2*3*5*7*11*13
```
